

DTW Incident Analysis

Cycle planning overview · May–July 2026

Signal-based vs treatment-based daily DTW flags
merged with Pylon tickets · episode durations · tag mix

Takeaway: use treatment grain for planning KPIs.
Signal grain overstates firefighting load; most DTW days never get a Pylon ticket.

Scope comparison

Dataset footprint

Metric	Signal	Treatment
Rows	3,804	8,588
Entities	119 signals	400 treatments
Accounts	17	14
Daily incident rate	72%	50%
Conversion share	90%	96%
Pylon tickets matched	421/438	397/438
DTW rows with ticket	146	123

Incident intensity by grain

Recommendations for this cycle

1. Baseline KPI (treatment / conversion): weekly incident rate $\approx 48\%$; median episode ≈ 6 days (signal median ≈ 10).
2. Plan capacity on treatment grain — signal grain ($\sim 72\%$ daily) overstates load.
3. Most DTW days have no Pylon ticket $\rightarrow$ ticket volume $\neq$ DTW coverage; improve gating before adding alert volume.
4. Tag mix is dominated by Nothing / No Performance Access / Deactivated / low spend $\rightarrow$ prioritize suppressions.
5. Causal is rare but long-lived (median weeks) — separate queue from high-throughput conversion.
6. Spend threshold helps a bit ($\approx 13\%$ vs $\approx 50\%$ incident rate) but does not solve the bulk problem.
